

POLYPITCH

A polyphonic pitch shift effect plugin with four independent voices.

Each voice has its own gain and pitch controls. Add sub-octaves, higher octaves or mix in other harmonic intervals to dramatically alter your sound. This plugin also includes Swell, Detune and Filter processing sections with which you can further shape your sound.

Controls

Voices

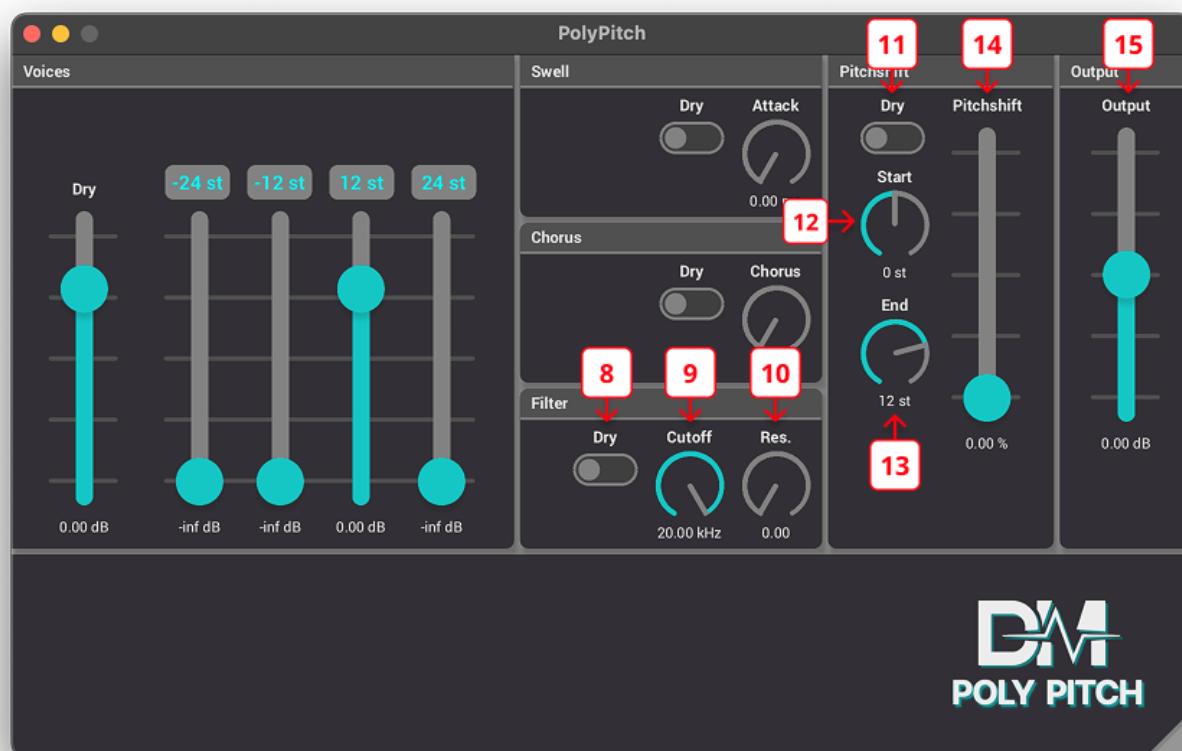

1. **Dry Gain**
Control the loudness of the dry signal.
2. **Voice 1, 2, 3, 4 Gain**
Control the loudness of the four independent voices.
3. **Voice 1, 2, 3, 4 Pitch**
Control the pitch of the four independent voices in semitones.

Swell

4. **Swell Dry On/Off**
Control if the swell effect is applied to the dry signal as well.
5. **Swell Attack**
Dial in the *Attack* to create a swell effect. This effect smoothly fades in the sound at onsets.

Chorus

N.B. Chorus can only be applied to voices with pitch set to 0 semitones or higher.

Filter

8. Filter Dry On/Off

Control if the filter effect is applied to the dry signal as well.

9. Filter Cutoff

Control the lowpass filter cutoff frequency in Hertz.

10. Filter Resonance

Control the lowpass filter resonance.

Pitchshift

11. Pitchshift Dry On/Off

Control if the global pitch shift effect is applied to the dry signal as well.

12. Pitchshift Start

Determine the start point of the pitch in semitones for the *Pitchshift* control. This will be the effective pitchshift heard when the *Pitchshift* control is set to 0%.

13. Pitchshift End

Determine the end point of the pitch in semitones for the *Pitchshift* control. This will be the effective pitchshift heard when the *Pitchshift* control is set to 100%.

14. Pitchshift

Control the amount of pitch shift applied. It can be used for smooth pitch sweeps and modulation. This pitch shift is applied on all voices and optionally on the dry signal as well.

Output

15. Output

Control the loudness of the overall output signal.
